

CostMate

AI-Powered Civil Estimation Platform

Bridging the gap between architectural design and tender-ready documentation. CostMate transforms how the construction industry predicts costs—turning days of manual calculation into minutes of verified, accurate output.

July 2026

Estimation is the Financial Backbone of Infrastructure

Before a single rupee is committed, estimation answers three critical questions: How much material? What is the rate? What is the total cost? This process dictates financing, tendering, and profitability.

Building Const.

Roads & Highways

Railways

EPC

\$780 Billion

India's construction market size (2026), growing at a rapid pace of 8.1% CAGR.

\$2.7 Billion

Global construction estimating software market, projected to reach \$5.6B by 2031.

Despite this massive scale, the core estimation workflow remains largely manual and fragmented.

THE FRICTION

A Structurally Manual Process in a Digital Era

Even firms using digital tools are only digitizing the ruler, not the brain. A human must still identify, click, and trace every element. This creates critical bottlenecks.

80%

of total estimating time is consumed by manual quantity takeoff alone, before pricing even begins.

98%

of megaprojects globally suffer from cost overruns, largely traceable to estimation and scope failures.

1%

annual productivity growth in construction over 20 years—the lowest of any major industry.

OUR APPROACH

AI Reads the Drawing. You Verify the Data. Done.

CostMate replaces the most time-consuming part of estimating—manual takeoff—while keeping a qualified human firmly in control of the final numbers.

01 **Upload** — Drop a PDF or image floor plan into the platform.

02 **AI Analysis** — A multi-agent AI swarm scans the drawing, extracting rooms, beams, columns, and footings.

03 **Human Review Gate** — [System Pauses] You review, edit, or use natural language (e.g., "Change all B1 beams to 10 inches") to correct data.

04 **Replicate** — Map typical floors once and replicate to all identical levels instantly.

05 **Calculate** — The engine applies CPWD DSR rates to generate precise civil and steel quantities.

06 **Export** — Download a tender-ready, multi-sheet Excel BOQ.

Human-in-the-Loop Interface

AI-generated extractions side-by-side with human verification controls

ELEMENT / ROOM

Column C1 (300×450mm)

Beam B1 (250×300mm)

Beam B2 (Review Gate) 30

Slab S1 (125mm Thick)

"Change B2 Beams to 10 inches..."

✓ Human Approved — Quantities verified and pushed to BOQ

Purpose-Built for Indian Civil Engineering Workflows

 CPWD/DSR Native Trained on Indian drawing conventions and rate schedules, not retrofitted from Western tools.	 Offline-First Architecture On-premise deployment for tender confidentiality and sites with zero internet dependency.	 Human Gate by Design Mandatory verification step before calculations run. Built for high-stakes financial accuracy.
 Conversational AI Copilot Execute bulk project edits via natural language chat, rather than manual cell-by-cell correction.	 Multi-Agent AI Swarm Specialized agents for OCR, dimensions, and validation orchestrated for high-accuracy tuning.	 Session Persistence Pause and resume long estimations across days without losing any extracted drawing data.
Traditional / Global Tools Manual click-and-trace takeoff US/UK-centric rate databases Cloud-only (data leaves your infra) CostMate AI vision auto-extraction India-first CPWD/DSR aligned Cloud + Offline/On-Premise options		

Measurable Impact from Day One

3x Faster

Tender Acceleration

Compress takeoff-to-draft-BOQ from days to minutes with automated vision AI.

60% More

Bid Capacity Increase

Increase tender capacity per estimator without adding headcount or overhead.

90% Fewer

Calculation Errors

Eliminate manual quantity mistakes that drive cost overruns and variation disputes.
